D3.2 Platform build, implementation and testing with relevant stakeholder groups [Confidential Deliverable]

Submitted: December 2020

Summary

An end-to-end data storage and management platform is a key component of Mobilise-D. This platform must ingest both questionnaire and sensor data, analyse it, and then make it accessible to users in other work packages. Deliverable D3.2 is one step in the design and implementation of this platform. It is defined as "Following initial development, and prior to deployment, the platform will undergo a series of functional performance evaluation processes to validate it against the functional requirements specifications." This report provides evidence that this has been achieved in the form of design documents, screen shots of the user interface, and logs and reports captured from the system when processing real data captured from Mobilise-D participants.
